

Syllabus Applied Mathematics

- Error analysis in numerical methods.
- Solution of non-linear equations: bisection, fixed point, Newton and quasi Newton methods.
- Solution of linear systems: Jacobi and Gauss-Seidel methods.
- Polynomial interpolation: definition, Lagrange polynomial. Divided differences. Newton interpolation formula. Spline interpolation.
- Least squares (data fitting): linear and non-linear problem (normal equations).
- Numerical differentiation: finite-difference formulae for functions of one and two variables.
- Numerical quadrature: simple and composite rules. Gaussian-Legendre quadrature.
- Numerical ordinary differential equations: introduction, initial value problem. Taylor and Runge-Kutta methods.
